Optic lobe development omb protein - fruit fly (Drosophila melanogaster)

N. Alternate names: omb protein
C. Species: Drosophila melanogaster
C. Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 10-Sep-1999
C. Accession: A40213; S34827
R. Pflugfelder, G.O.; Roth, H.; Poeck, B.; Kerscher, S.; Schwarz, H.; Jonschker, B.; H
Proc. Natl. Acad. Sci. U.S.A. 89, 1199-1203, 1992
A; Title: The lethal(1)optomotor-bind gene of Drosophila melanogaster is a major orga
A; Reference number: A40213; MUD: 92159016
A; Reference number: A40213
A; Status: preliminary: not compared with conceptual translation
A; Molecule type: mRNA
A; Molecule type: mRNA
A; Residues: 1-974 <PFL>
A; Cross-references: GB: M81796; NID: 9158018; PIDN: AAA28736...; PID: 9158019
A; Note: sequence extracted from NCB1 backbone (NCBIP: 82056)

probable o-methyltransferase - Mycobacterium tuberculosis (strain H37RV)
C;Species: Mycobacterium tuberculosis
R;Cole, S.T.; Brosch, R.; Parkhill, J.; Garnier, T.; Churcher, C.; Harris, D.; Gordon; Connor, R.; Davies, R.; Devilin, K.; Feltwell, T.; Gentles, S.; Hamlin, N.; Holroyd, Rajandream, M.A.; Rogers, J.; Rutter, S.; Seeger, K.; Skelton, S.; Squares, S.
Nature 393, 537-544, 1998
A;Reference fumber: A70500; MUD:98295987
A;Title: Decalphering the biology of Mycobacterium tuberculosis from the complete geno A;Reference fumber: A70500; MUD:98295987
A;Accession: F70503
A;Status: preliminary; nucleic acid sequence not shown; translation not shown A;Molecule type: DNA

"The preparation, purification, and amino acid sequence of a polypeptide renin substrate.";
J. Exp. Med. 106:439-453(1957).
-1- FUNCTION: IN RESPONSE TO LOWERED BLOOD PRESSURE, THE ENZYME RENIN CLEAVES ANGIOTENSIN I, FROM ANGIOTENSIN. GRANGIOTENSIN I, FROM ANGIOTENSIN. GRANGIOTENSIN PRESSOR SECRIBED THE PHYSIOLOGICALLY ACTIVE PEPTIDE ANGIOTENSIN II, THE MOST POTENT PRESSOR SUBSTANCE KNOWN, WHICH HELPS REGULATE VOLUME AND MINERAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -i- FUNCTION: PROBABLE TRANSCRIPTIONAL REGULATOR INVOLVED IN
DEVELOPMENTAL PROCESSES. COULD BE REQUIRED FOR SPECIFICATION OF
PARAXIAL MESOBERM STRUCTURES DURING GASTRULATION (BY SIMILARITY).
-i- SUBUNIT: FORMS A DIMERIC COMPLEX WITH DNA (IN VITRO).
-i- SUBCELLULAR LOCATION: Nuclear (Potential).
-i- TISSUE SPECIFICITY: EXPRESSED IN PETAL TAIL BUD, POSTERIOR SPINAL
TISSUE, INTERVERTEBRAL DISC AND TESTIS, ALSO EXPRESSED IN ADULT
TESTIS, KIDNEY, LUNG, MUSCLE AND THYMUS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE-99134303; PubMed-9933572; Papapetrou C., Putt W., Fox M., Edwards Y.H.; Papapetrou C., Putt W., Fox M., Edwards Y.H.; Phuman TBX6 gene: cloning and assignment to chromosome 16p11.2."; Genomics 55:238-241(1999).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBCELLULAR LOCATION: Nuclear (Potential).
DEVELOPMENTAL STAGE: TBX6 IS FIRST DETECTED IN THE GASTRULATION STAGE IN THE PRIMITIVE STREAK AND NEWLY RECRUITED PARAXIAL MESODERM. LATER IN DEVELOPMENT IT IS RESTRICTED TO PRESOMITIC, PARAXIAL MESODERM AND TO THE TAIL BUD, WHICH REPLACES THE STREAK AS THE SOURCE OF MESODERM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Takel Y., Hasegawa Y.;
"Vasopressor and depressor effects of native angiotensins and inhibition of these effects in the Japanese quail.";
Gen. Comp. Endocrinol. 79:12-22(1990).
-!- FUNCTION: IN RESPONSE TO LOMERED BLOOD PRESSURE, THE ENZYME RENIN CLEAVES ANGIOTENSIN I. FROM ANGIOTENSINGEN. ACE (ANGIOTENSIN ENTING CONVERTING ENZYME) THEN REMOVES A DIPEPTIDE TO YIELD THE PHYSIOLOGICALLY ACTIVE PEPTIDE ANGIOTENSIN II, THE MOST POTENT PRESSOR SUBSTANCE KNOWN, WHICH HELPS REGULATE VOLUME AND MINERAL BALANCE OF BODY FLUIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

-!- FUNCTION: FERREDOXINS ARE IRON-SULFUR PROTEINS THAT TRANSFER ELECTRONS IN A WIDE VARIETY OF METABOLIC REACTIONS.
-!- COPACTOR: BINDS J.4FE-4S CLUSTER AND A 3FE-4S CLUSTER.
-!- SIMILARITY: BELONGS TO THE BACTERIAL TYPE FERREDOXIN FAMILY.

-i- FUNCTION: FERRITIN IS AN INTRACELLULAR MOLECULE THAT STORES IRON
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IN 3A SOLUBLE, NONTOXIC, READILY AVAILABLE FORM. THE FUNCTIONAL MOLECULE, WHICH IS COMPOSED OF 24 CHAINS, IS ROUGHLY SPHERICAL AND CONTAINS A CENTRAL CAVITY IN WHICH THE POLYMERIC FERRIC IRON CORE IS DEPOSITED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- SUBCELLULAR LOCATION: CHLOROPLAST AND OTHER PLASTIDS.
-!- TISSUE SPECIFICITY: FERRITINS ACCUMULATE IN SEED DURING MATURATION. THEN THE DEGRADED DURING THE FIRST DAYS OF GERMINATION. PRESENT IN ROOTS AND LEAVES AFTER IRON TREATMENT.
-!- INDUCTION: BY IRON.
-!- SIMILARITY: BELONGS TO THE FERRITIN FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  suggests a role in controlling chick limb-type identity.";
Development 125:2835(1998).
-1-FUNCTION: TRANSCREPTIONAL REPRESSOR INVOLVED IN DEVELOPMENTAL PROCESSES. PROBABLY PLAYS A ROLE IN LIMB PATTERN FORMATION.
-1-SUBCELLULAR LOCATION: Nuclear (Potential).
-1-SIMILARITY: CONTAINS 1 T-BOX DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.

Cloning and mapping of a human gene (TBX2) sharing a highly conserved protein motif with the Drosophila omb gene.";
                                  SUBCELLULAR LOCATION: Nuclear (Potential).

TISSUE SPECIFICTY: IN ADULTS, HIGHEST LEVELS IN LUNG. ALSO FOUND IN HEART, KIDNEY, AND OVARY.

DEVELOPMENTAL STAGE: EXPRESSION FIRST OBSERVED AT DAY 9.5 IN THE OTIC AND OPTIC VESICLES AND IN THE PACIAL REGION. AT DAY AND LIMB BUD MESENCHYME. IN LATER STAGES, FOUND IN EAR PINNAE, THE MILK LINE, LUNG MESENCHYME, IN LATER STAGES, FOUND IN EAR PINNAE, THE MILK LINE, LUNG MESENCHYME, BODY WALL. GENITAL RIDGE AND DEVELOPING NERVOUS SYSTEM.

T (Cleavage and polyadenylation factor CPF specifically interacts with the pre-mRNA 3' processing signal AAUAAA.";

L EMBO J. 10:4241-4249(1991).

- !- FUNCTION: CPSF PLAYS A KEY ROLE IN PRE-MRNA 3'-END FORMATION, PRECOGNIZING THE AAUAAA SIGNAL SEQUENCE AND INTERACTING WITH POLY (A POLYMERASE AND OTHER FACTORS TO BRING ABOUT CLEAVAGE AND POLY (A) POLYMERASE AND OTHER FACTORS TO BRING ABOUT CLEAVAGE AND POLY (A) ADDITION. THIS SUBUNIT IS INVOLVED IN THE RNA RECGNITION STEP OF THE DOLYADENTALION REACTION.

- !- SUBUNIT: CPSF IS A HETEROTERAMER COMPOSED OF FOUR DISTINCT SUBUNIT: CPSF IS A HETEROTERAMER COMPOSED OF FOUR DISTINCT C.: SUBUNIT: LANG 100, 70 AND 30 kDa.

- !- SUBCLILLAR LOCATION. NUCLEAR; nucleoplasm.

- !- PTM: THE N-TERMINUS IS BLOCKED.

- !- SIMILARITY: BELONGS TO THE CPSF160 FAMILY.
01-0CT-1996 (Rel. 34, Last sequence update)
16-0CT-2001 (Rel. 40, Last annotation update)
Cleavage and polyadenylation specificity factor, 160 kDa subunit (CPSF 160 kDa subunit).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            "Cloning of cDNAs encoding the 160 kDa subunit of the bovine cleavage and polyadenylation specificity factor."; Nucleic Acids Res. 23:2629-2635(1995).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mRNA processing; Nuclear protein; RNA-binding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SUBCELLUIAR LOCATION: Nuclear (Potential).

DEVELOPMENTAL STAGE: FIRST EXPRESSED AT DAY 7.5, EXCLUSIVELY IN THE ALLANTOIS WHREE EXPRESSION CONTINUES THROUGH DAY 8.5. AT DAY 9.5, EXPRESSION IS FOUND IN THE GENTRAL PAPILLA, BODY WALL AND LIMB BUDS (HIGHER LEVELS IN HINDLIMB). AT DAY 12.5, EXPRESSED IN SURROUNDING THE TRACHEA. ALSO FOUND IN THE SINUS VENOSUS/COMMON ATRIUM OF THE DEVELOPING HEART.

Gene 180:137-144(1996).
-!-CATALYTIC ACTIVITY: UDP-glucose = UDP-galactose.
-!-COFACTOR: NAD.
-!-PATHWAY: GALACTOSE METABOLISM.
-!-SUBUNIT: HOMODIMER (BY SIMILARITY).
-!-SIMILARITY: BELONGS TO THE SUGAR EPIMERASE FAMILY.
                                                                                                                                                                        NAD (POTENTIAL).

I- FUNCTION: CAPALYESES DISTINGT CARBOXYPEPTIDATION AND TRANSPEPTIDATION REACTIONS DURING THE LAST STAGES OF WALL PEPTIDOGLYCAN SYNTHESIS. MISTARING A BETA-LACTAM ANTIBIOTIC MOLECULE FOR A NORMAL SUBSTRATE (I.E. A D-ALANTY-D-ALANINE-TERMINATED PEPTIDE), IT BECOMES IMMOBILIZED IN THE FORM OF A LONG-LIVED, SERINE-ESTRE-LINED ACYL ENZYME AND THUS BEHAVE AS PENICILLIN BINDING PROTEIN (PBP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
